

Product Carbon Footprint  
**Dell S3221QS Monitor**  
 Report Produced September 2022

At Dell Technologies we are working to reduce the environmental impact of our products. We look at every part of the product's lifecycle, from materials, manufacturing, and shipping to use and end-of-life management after it leaves our doors.

To calculate this Dell Technologies uses PAIA (Product Attribute to Impact Algorithm) to perform product carbon footprints. PAIA is a streamlined Life-Cycle Assessment (LCA) tool developed by [MIT's Materials System Laboratory](#). It takes into consideration important attributes of the product which can be correlated to activities in order to calculate the product carbon footprint.

Carbon footprint calculations have a wide range based on a variety of factors including how the device is configured, where it was manufactured and more. Dell Technologies reports the 5th and 95th percentile of the carbon footprint estimate to reflect that uncertainty. For this product, that estimate has a mean of 763 kg of CO2e and standard deviation of 227 kg of CO2e.

Assumptions for calculating product carbon footprint:

<b>Product Weight</b>	10.5 kg	<b>Screen Size</b>	31.5"	<b>Assembly Location</b>	China
<b>Product Lifetime</b>	6 years	<b>Use Location</b>	EU	<b>Energy Demand (Yearly TEC)</b>	109 kWh

## ESTIMATED IMPACT BY LIFECYCLE STAGE
