

Make security top of mind in your organization

Provide concise, easy-to-learn security training for your employees

Managed Security Awareness Training

Reduce the risk of employee-related security incidents with customized, year-round training

The majority of cyberattacks can be tied back to human error. In fact, 82% of breaches in the last year involved a human component.¹ Your employee's ability to recognize a cyber threat and prevent a breach directly depends on their cybersecurity knowledge. However, annual employee security training is often considered a "check-the-box exercise" and is not retained by employees. Organizations need a better way to educate their employees to prevent breaches from happening and strengthen their security posture.

Managed Security Awareness Training

With Dell Managed Security Awareness Training, Dell security experts assign concise, easy-to-learn training modules directly to your employee's email inboxes. The modules are delivered year-round and can be customized to employee roles, level of threat exposure and employee progress. Year-round delivery and customization ensure modules are relevant for your employees and impactful for your organization's overall security posture.

The Dell team provides monthly reports to your customer portal containing data on your employee's progress so you can stay up to date. Additionally, future training modules can be assigned to each employee based on their progress and results.

With Managed Security Awareness Training, you can focus on your core business goals and let Dell handle your employee security training, all while reducing your risk of a cyberattack.

Key Benefits

- Provide security training to your employees in bite-sized modules, including videos, PDFs, quizzes and exams
- Customize training for your employees based on roles, level of threat exposure and progress
- Receive monthly reports with data on each employee's progress through your customer portal
- Focus on your core business goals as training is fully delivered and managed by Dell
- Improve security posture with enhanced employee knowledge and awareness
- Create an organizational culture change surrounding cybersecurity
